

SPS SmartControl

With the SPS SmartControl platform, analyses are provided for flood risk areas, sewer overflow, and stormwater infiltration into the wastewater system, as well as operational information for maintenance.

A digital overview of sewer and stormwater systems is available through map views, warning symbols, real-time monitoring, and alarm systems. Real-time monitoring enables rapid response actions. With SPS SmartControl, the need for physical site visits is reduced.

The route planner for sealed tanks presents optimized routes for emptying logistics, fully aligned with Agenda 2030 and the Global Goals for Sustainable Development. This makes the solution cost-effective and climate-smart.

A digital overview of hundreds of units with SPS SmartControl is available in real time, directly on mobile, computer, or tablet.
